
Spin-1 large-D chain: certified bounds and ED screening
Numerical scan, $n_0 \le 6$
Certified bounds / enclosed Δ_{12}
$D = 4$: transfer seed $n_0 = 12$
plus finite bridge to $L \ge 6$
Sampled $D \le 3.205$: no seed on the tested grid.
This does not imply a zero gap.
Uniform bound B / Δ_{12}

D
Denominator: finite periodic $L = 12$ gap, not the infinite-chain gap.
Curves connect sampled numerical values only; certificates are the marked points.
